

Project Design Phase-II

Technology Stack (Architecture & Stack)

Field	Details
Date	28 September 2026
Team ID	SWTID-2026-4815
Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	4 Marks

Architecture Flow:

User (Browser) -> ServiceNow UI (Incident Form/List View) -> High Impact Control UI Policy Engine -> Client Script Engine (GlideForm API - g_form) -> ServiceNow Server -> Incident Table (ServiceNow DB)

Table-1: Components & Technologies

S.No	Component	Description	Technology
1	User Interface	Incident form & list view rendering	ServiceNow UI (Now Platform, UI16/UI18)
2	Declarative Logic	Assignment group mandatory and Urgency read-only control based on Impact condition	UI Policy (High Impact Control) + UI Policy Action
3	Client-side Scripting	Real-time Urgency auto-set, Assigned To validation, State edit protection	Client Scripts (onChange, onSubmit, onCellEdit) - JavaScript, GlideForm (g_form) API
4	Database	Stores Incident records	ServiceNow native database (MySQL-based backend)
5	Platform	Hosting environment	ServiceNow Cloud (PaaS)
6	Access Control	Role-based configuration access	ServiceNow ACLs (Access Control Rules)

Table-2: Application Characteristics

S.No	Characteristics	Description	Technology
1	Open-Source Frameworks	Not applicable - native ServiceNow platform used	ServiceNow Now Platform (proprietary)
2	Security	Role-based access (ITIL/admin roles) for config changes	ServiceNow ACL, Role-Based Access Control
3	Scalable Architecture	Logic is modular - same pattern reusable for other conditions/fields	UI Policy + Client Script framework
4	Availability	Cloud-hosted ServiceNow instance, high uptime SLA	ServiceNow multi-instance cloud architecture
5	Performance	Client-side scripts run in browser - minimal server round-trips	GlideForm API, client-side JS execution
